1. Project Quality: ★★★☆ (3.5)

a) Requirements:

Requirements	Situation	Comments
Client	Ok	- I liked the layout, I thought it was cool to have the book collection and wish list, it just wasn't clear if the user can view the collection and wish list of friends, and if possible I think it's interesting to let the user choose whether or not to show your collections. - I liked the minimalist design of the page; I think it would be nice if we could see which book the user is currently reading. - I liked the layout because it was simple and easy to navigate. I think it would be interesting to add a dark mode.
Admin	Missing	This page was not found.
Products	Ok	- I liked the layout, it was nice and clean, but it could have more categories and filters - The layout is nice and objective, I think it would be nice with more categories, such as which books are 'trending this week' or 'more books of your favorite author'. I also think it would be nice to see the price of the books. - The layout is organized and objective, but it could have more features.
Product Sale	Missing	This page was not found.
Product Management	Missing	This page was not found.
The group Functionality	Ok	- The new features chosen were well thought out and are consistent with the character of the project, but not all were presented in the mockup. - The features match with the project proposal, but some of them weren't in the mockup. - The ideas are good and are according to the project description. However, not all were presented.

b) Project Description:

Project-specific features have been placed in the description but should be in the requirements, the description could be more complete and go deeper into how the features will be implemented and why. Features such as the bookmark and friends system weren't explained.

c) Comments About Code: *If the group made some*
d) Plans and Test Results:
e) Build Procedures:
g) *Problems, General Work Quality, etc.*
f) Group Interactions:

2. Code Quality: ★ ★ ★ ★ ★ (4.5)

a) Code Design and frameworks' use:

The code design is well done, the use of Google Fonts and the bootstrap was a good choice, the code is well indented, good use of names for elements, classes, ids, filenames, it's easy to understand. However, the images do not have names that are intuitive or that represent their content, and the <img> tags in the html are without the alt attribute, which does not contribute to the accessibility of the site.

b) Code Organization:

The code organization is good, separating the different file types into different folders. Since the project is still starting and doesn't have much code to analyze, it's too early to make a deeper evaluation.

c) How the code works:

There's not much to explain, for now it's a simple HTML that uses CSS to style the content. As the project progresses and the backend is being developed, it will be possible to explain how it works.

d) Code Documentation:

It does not have in-line comments, but most class and id names are self-explanatory. For now, it is good and easy to understand.

3. What you would make differently:

The home page layout doesn't remind me of a store, I would add more category blocks right away, more filters, more images and banners, new releases could be more prominent, promotions more apparent. Also, prices are not being shown. On the user's home page I would leave the friends block for last and bring the block of my collections and bookmarks to the top.

I would add the 'recently read' tab in the profile page so the focus of the main page can be the new books the client could buy; the bookmarks could show the book's title to make navigation easier.

Suggestions and ideas:
- The reading tool must be well implemented and allow zooming in and out, allowing page and chapter change at any time and the possibility to mark the place where you stopped reading to go back there later.
- You could implement the functionality to add public comments for each chapter of a book that can be viewed at the bottom of the reading page.
- If you allow the profile of friends to be viewable, it is important that you add the functionality of viewing permission, that is, the user who decides whether he wants to make his profile viewable or not.
- You could separate books by genre (i.e mystery, romance, etc) and add a search functionality for it, with search exclude included (possibility to not show one or more specific genre).
- You could add your favorite books and the ones you're currently reading in your profile.
- Add a "recommend books to friends" feature. You could even turn this feature into a way to increase sales, for example, if a friend buys a book you recommended, both get a 5% coupon on the next purchase.
- For this type of store, especially with the possibility of evaluating the content and public profile, an area of interaction between users is very good, in the future you could implement a discussion forum or blog.
